Actinogen Alzheimer drug misses main goal but benefits patients over 75

11 SOURCES

Key Facts | Full Coverage

- **Actinogen Medical** announced topline results November 19, 2026 from its pivotal **XanaMIA Phase 2b/3 trial** of Xanamem in 247 patients with mild to moderate Alzheimer's.
- The trial missed its primary CDR-SB endpoint in the overall population, showing a non-significant 0.10-point benefit at Week 36 (p=0.65).
- In patients over 75 (about half the trial), **Xanamem** delivered a statistically significant 40% with zero disease progression on CDR-SB vs 22% on placebo (p=0.02).
- The same older subgroup showed a clinically meaningful 30% slowing of progression (0.39-point mean advantage, p=0.22).
- Xanamem had a favorable safety profile over 36 weeks with no serious drug-related adverse events.
- Actinogen has $18.9 million in cash, providing runway into 2028, and will release open-label extension data in Q1 2027.

Actinogen shares fell as much as 88% on the mixed results announcement.
